Precautionary Pulp: *Pulp Mills* and the Evolving Dispute between International Tribunals over the Reach of the Precautionary Principle

Daniel Kazhdan*

While the term "precautionary principle" is much used, its status, its applicability, and even its definition are not clear. The International Tribunal for the Law of the Sea has applied the precautionary principle in environmental cases. The World Trade Organization has refused to apply the principle, but, in dicta, has suggested that it should be applied in environmental cases. The International Court of Justice has traditionally been reticent on the issue. However, in its recent Pulp Mills decision, the court strongly limited, if not eviscerated, the principle. The court did not allow the precautionary principle to reverse the burden of proof or even to affect the standards of proof.

INTRODUCTION

Pulp Mills on the River Uruguay (Argentina v. Uruguay),¹ decided in 2010 by the International Court of Justice (ICJ),² reversed a trend within international environmental law of reading the precautionary principle broadly. The precautionary principle first became prominent in discussions of environmental law in 1992,³ and until 2010 was frequently read as implying that precautions must be taken when a risk of environmental harm exists, even if conclusive scientific evidence is lacking.⁴ When invoking this principle, other tribunals had called for a lower standard of proof of environmental harm or, more radically, argued that the burden of proof in environmental cases lay with the defendants rather than the plaintiffs.⁵ Pulp Mills rejected both of these readings, leaving only a vaguely defined and weak precautionary principle.

Pulp Mills decided a conflict between Argentina and Uruguay: Argentina accused Uruguay of authorizing construction of a pulp mill that polluted the Uruguay River, violating the countries’ treaty regarding the protection of the river.⁶ Argentina argued that under the precautionary principle, Uruguay, the defendant, was responsible for proving that the mill would not cause significant harm to the environment.⁷ The ICJ explicitly rejected Argentina’s use of the precautionary principle to shift the burden of proof,⁸ and more subtly rejected the more conservative proposition that the precautionary principle lowered the standard of proof required of Argentina to show environmental harm.⁹

To provide background for this Note’s analysis, Part I analyzes various definitions of the precautionary principle invoked both by tribunals and by scholars. Part II argues that tribunals other than the ICJ have increasingly accepted broad definitions of the principle. Finally, Part III contends that the ICJ has historically avoided applying the precautionary principle. When, in Pulp Mills, the court finally did address the principle, the ICJ eviscerated it.

I. PITFALLS IN DEFINING THE PRECAUTIONARY PRINCIPLE

While frequently mentioned by courts, the "precautionary principle" has no clear, commonly agreed-upon definition; it has been applied in many different ways to very different situations. At the most basic level, the principle mandates some response even when threat of harm is uncertain. But the threshold degree of uncertainty, the magnitude of harm threatened, and the type of response necessary are all much debated. Invocation of the precautionary principle requires proving a threshold level of harm. According to some sources, the risk of harm must be "serious and irreversible," according to others "serious or irreversible," while still others require only "reasonable grounds for concern." There is also no uniform definition of what constitutes "serious" harm, although the duration and geographic scope of the damage are certainly considerations. Once this threshold is met, precaution is legally required.

12. See id.
13. See id. at 56 (citing sources).
15. E.g., Convention for the Protection of the Marine Environment of the North-East Atlantic, art. 2, Sept. 22, 1992, 32 I.L.M. 1069; Nordic Council’s International Conference on the Pollution of the Seas: Final Document Agreed To, Oct. 18, 1989, in Nordic Action Plan on Pollution of the Seas, 99 app. V (1990) (requiring “reason to believe that damage or harmful effects are likely to be caused”); Convention on the Protection of the Marine Environment of the Baltic Sea Area (Helsinki Convention) art. 3, Jan. 17, 2000 available at http://www.helcom.fi/Convention/enGB/text/ (requiring “reason to assume that substances or energy introduced . . . may create hazards to human health, harm living resources and marine ecosystems, damage amenities or interfere with other legitimate uses of the sea”). See generally TROUWBORST, supra note 4, at 45–47, 62–64 (collecting treaties that apply precaution without mention of “significant risk” and arguing that the majority view is if damage is serious or irreversible, there is a duty to take precautionary measures).
18. See, e.g., TROUWBORST, supra note 4, at 121 (arguing that countries are only required to takes precautionary measures if the anticipated harm is significant and either serious or irreversible. If it is only significant, he argues, countries may take precautionary measures, but they are not required to do so.).
Furthermore, even when harm is severe, there is no agreement regarding who bears the burden of proof that harm will or will not occur and what the standard of proof is. Some authorities argue that if the threshold of harm is met, the burden of proof should shift to the party claiming that the harm will be insubstantial. Others argue that precaution merely reduces the standard of proof required of the side claiming harm. Finally, a minority believes that precaution should not affect the standard or burden of proof. Instead, precaution should affect how a court responds to claims of potential harm, such as whether to impose an injunction or less severe restrictions on actions.

The lack of a clear, consistent definition complicates efforts to compare the holdings of international tribunals on precaution. While many courts and litigants invoke the principle, how they understand the principle may differ.

22. See COMM’N OF THE EUROPEAN CMTYS, COMMUNICATION ON THE PRECAUTIONARY PRINCIPLE 1, ¶ 6.3.1 (2000), available at http://ec.europa.eu/dgs/health_consumer/library/pub/pub07_en.pdf. Indeed, the U.S. common law development of a strict liability standard for abnormally dangerous activities can be seen as an early form of the precautionary principle. See RESTATEMENT (SECOND) OF TORTS § 519(1) (1977) (citing cases dating back to the nineteenth century to this effect). Strict liability is only imposed if the degree of risk is high, and the possible harm is great. See id. § 520(a), (b); see also Ind. Harbor Belt R.R. Co. v. American Cyanamid Co., 916 F.2d 1174, 1177 (7th Cir. 1990) (stating that the purpose of strict liability is to “give [the actor] an incentive . . . to experiment with methods of preventing accidents [by] relocating, changing, or reducing (perhaps to the vanishing point) the activity”). Thus, the purpose of strict liability ranges from shifting the way an act is performed to effectively enjoining it—just like the forms of the precautionary principle advocated by the COMM’N OF THE EUROPEAN CMTYS., COMMUNICATION ON THE PRECAUTIONARY PRINCIPLE 1, ¶ 6.3.1 (2000) (“In some cases a total ban may not be a proportional response to a potential risk. In other cases, it may be the sole possible response to a potential risk.”). I would further suggest that a reason for strict liability for ultrahazardous activities is that the extent of the possible harm, while certainly great, may often be uncertain. Strict liability reverses the burden of paying for this risk, thus forcing the actor to take precautionary measures despite uncertain harm (as opposed to the negligence regime where if an action is not deemed unsafe then the actor does not pay for harm that arises). The distinction between strict liability and the precautionary principle is that strict liability relies on market forces to determine the appropriate amount of risks whereas the precautionary principle uses governmental oversight. For discussion of the costs and benefits of these two forms of regulation, see generally James A. Sweney, Market versus Command and Control Environmental Policies, 26 J. ECON. ISSUES 623 (1992); Nathaniel O. Keohane, Richard L. Revesz, & Robert N. Stavins, The Choice of Regulatory Instruments in Environmental Policy, 22 HARV. ENV’T L. REV. 313 (1998).
Further, some authorities refer to the precautionary principle, while others refer to a precautionary approach, and it is not clear whether the two terms are intended to refer to the same concept. This Note interprets various references to the precautionary principle within the context of specific judicial decisions, without assuming the precautionary principle carries a singular meaning. Thus, the term a court employs—"precautionary principle," "precautionary approach," "caution," or some other term—is irrelevant. What matters is how the court understands how precaution affects legal obligations.

II. PRECAUTIONARY PRINCIPLE IN THE INTERNATIONAL TRIBUNAL FOR THE LAW OF THE SEA AND THE WORLD TRADE ORGANIZATION

One source of international law is custom accepted by many countries. Custom can be identified by examining "judicial decisions and the teachings of the most highly qualified publicists of the various nations." While the opinions of these authorities are not binding, they help define customary international law. This is especially true of international tribunals, whose

28. This could also be evidence of another source of international law: "general principles of the law recognized by civilized nations." Id.
decisions, as a practical matter, "acquire quasi-legislative value." This Note will examine the decisions of select tribunals to help clarify the overall status of the precautionary principle within international law, although use of the precautionary principle is by no means limited to these tribunals.

The _Trail Smelter Case_ offers an example of how international environmental law approached questions of burden and standard of proof before the development of the precautionary principle. In the 1920s, two smelter plants built near the U.S. border, in Trail, Canada, were emitting large amounts of sulfur that passed into the United States. When the United States complained, Canada agreed to submit the case to arbitration. The parties agreed to be bound by the law of "the United States of America as well as international law and practice." In 1941, the tribunal granted monetary damages to the United States and also enjoined the smelters from causing future damage. As part of its decision, the tribunal placed the burden of proof on the United States (the plaintiff), and explained that the standard of proof "under the principles of international law [was] clear and convincing evidence." That the case was "of serious consequence" did not lower the standard or shift the burden of proof, as it might have after the development of the precautionary principle.

The thinking shifted in 1992, when the United Nations Conference on Environment and Development issued the _Rio Declaration on Environment and Development_ (Rio Declaration). While the Rio Declaration was not legally binding, it is the most cited international agreement regarding the precautionary principle, and many environmental cases after 1992 invoke the

Indeed, a Westlaw search of "precautionary approach" within the International Legal Materials
precautionary principle. From this point on, international tribunals began to invoke precaution to reshape standards and burdens of proof in determining matters of international environmental law. In particular, the International Tribunal for the Law of the Sea and the World Trade Organization have embraced the use of the precautionary principle in their cases.

A. International Tribunal for the Law of the Sea

The International Tribunal for the Law of the Sea (ITLOS) has treated the precautionary principle as customary international law. Therefore, in such cases ITLOS has lowered standards of proof and potentially even shifted the burden of proof.

In 1999, ITLOS decided the Bluefin Tuna Cases and based part of its decisions on this reading of precaution. The cases grew out of the Convention for the Conservation of Southern Bluefin Tuna, a 1993 treaty between Australia, Japan, and New Zealand. This treaty granted a total allowable catch for the member states. In 1998, Japan unilaterally increased the number of southern bluefin tuna it caught, claiming the additional catch was experimental. Australia and New Zealand sued Japan in ITLOS, explicitly invoking the precautionary principle. ITLOS ultimately enjoined Japan from increasing its total allowable catch and from claiming that its catch was experimental and therefore not subject to the limitations of the agreement.

Although ITLOS did not explicitly mention the precautionary principle in its decisions, many commentators have noted that the decision relied heavily on
ITLOS explicitly referred to the "scientific uncertainty regarding measures to be taken to conserve the stock of southern bluefin tuna," which, combined with the risk of "deterioration of the southern bluefin tuna stock" and the risk of "serious harm" to the bluefin tuna, led the tribunal to grant provisional measures. Indeed, in a recent opinion, ITLOS declared that the *Bluefin Tuna Cases* implicitly adopted the precautionary principle. Based on the idea of precaution, the tribunal thus decided in favor of New Zealand and Australia, despite scientific uncertainty. This suggests that the precautionary principle had either lowered the burden of proof for the plaintiffs or shifted the burden of proof onto the defendants. Moreover, the remedy—an injunction on increased fishing—was precautionary as well.

It seems that Judge Wolfrum, one of the judges in the 2011 advisory opinion, changed his opinion of the status of the precautionary principle from his earlier decision in the *ITLOS MOX Case*. See *The MOX Plant Case* (Ir. v. U.K.), Provisional Measures, INT'L TRIB. L. OF THE SEA, http://www.itlos.org (last visited Mar. 10, 2011) (follow "Proceedings & Cases" hyperlink, then follow "List of Cases" hyperlink, then "Case No. 10" hyperlink) (separate opinion of Judge Wolfrum) ("It is still a matter of discussion whether the precautionary principle or the precautionary approach in international environmental law has become part of customary international law. The Tribunal did not speak of the precautionary principle or approach in its Order in the Southern Bluefin Tuna Cases.").

58. *See id.* ¶ 21 (separate opinion of Judge Laing) ("[T]he Tribunal has drawn its conclusions and based its prescriptions in the face of scientific uncertainty, [but] it has not, per se, engaged in an explicit reversal of the burden of proof.").

59. *See id.* ¶ 89 (opinion of the tribunal).
Three years later, ITLOS decided the MOX Plant Case (Ireland v. United Kingdom), which on the surface suggested a different approach to precaution. In 2001, Britain authorized the commission of a mixed oxide fuel (MOX) plant—a plant that processes spent nuclear fuel for the purpose of producing energy—next to a nuclear processing site. Concerned with the possible pollution in the Irish Sea, Ireland submitted the case for arbitration to the Permanent Court of Arbitration. At the same time, it requested that ITLOS provisionally enjoin the United Kingdom from opening the mill until the arbitration panel decided the case. Ireland claimed a risk of irreparable harm, as even the temporary operation of the plant would discharge plutonium into the Irish Sea. In addition, if the tribunal waited to consider remedies until the plant began operating, the Permanent Court of Arbitration would be less likely to mandate its closure because of the existing investment. Ireland also argued, basing itself on the precautionary principle, that the United Kingdom should bear the burden of proving the safety of the MOX plant. The United Kingdom, on the other hand, claimed that the risk of pollution from the MOX plant was at most “infinitesimally small,” especially between the time of commission and the time the arbitration panel ruled. At the same time, the United Kingdom agreed not to increase the amount of nuclear waste transported to or from the original plant and to postpone any import of MOX fuel for several months, under the assumption that by that time the Permanent Court of Arbitration would rule on the merits. ITLOS agreed with the United

65. See id., ¶ 70.

66. See id., ¶ 71.

67. See id., ¶ 72.

Kingdom and ruled that there was insufficient urgency to grant the preliminary injunction that Ireland requested.69

The procedural posture in the MOX Plant Case was similar to that in the Bluefin Tuna Cases. In both cases, the plaintiff requested a preliminary injunction so that the defendant would not endanger the environment. Yet only in the Bluefin Tuna Cases did ITLOS grant an injunction. Nonetheless, the MOX Plant Case does not reflect a changing position on the precautionary principle. The unanimous tribunal70 declared that the case lacked urgency, in part because the Permanent Court of Arbitration would rule on this issue soon thereafter, and thus rejected Ireland's request for precaution.71 The tribunal's decision is unclear on the issue of whether precaution was relevant at all. However, the concurrences of ten of the judges indicate that this denial of Ireland's request was not a rejection of precaution more broadly.72 Thus, when Pulp Mills was decided, the Bluefin Tuna Cases represented ITLOS's position on issues of precaution.

B. World Trade Organization

While the World Trade Organization (WTO) has not had the opportunity to rule on precaution in environmental cases, dicta in its rulings in non-environmental cases offer support for use of the precautionary principle in international environmental law.

Increasingly, the WTO has lent credence to the precautionary principle in rulings on suits between the United States and countries that have attempted to block U.S. imports.73 In 1988, the European Union began banning the use of growth hormones on livestock and the import of such livestock while the

70. See id. ¶ 81.

72. Eight judges explicitly contrasted the facts of this case with the Bluefin Tuna Cases. See id. (joint declaration of Judges Caminos, Yamamoto, Park, Akl, Marsit, Eiriksson and Jesus) (explaining that unlike the ITLOS Bluefin Tuna Cases, in the ITLOS MOX Case, “the urgency of the situation did not require it to lay down, as binding legal obligations, the measures requested by Ireland”); id. (separate opinion of Judge Wolfrum) (explaining why the precautionary principle was inapposite here). Judge Treves explained that had Ireland shown more urgency, “precautionary considerations” would have been warranted. See id. (separate opinion of Judge Treves). Judge ad hoc Székely would have granted Ireland’s motion for provisional measures. See id. (separate opinion of Judge ad hoc Székely).
73. The WTO is a global organization dealing with the trade between nations. It was established in 1995. See WORLD TRADE ORG., http://www.wto.org/english/thewto_e/whatis_e/whatis_e.htm (last visited Mar. 2, 2011).
United States permitted such use. In 1996, the United States sued the European Union in the WTO for unfair trade practices. The WTO panel ruled in favor of the United States and Europe appealed. One of the European Union's arguments was that the precautionary principle affected the assessment of risk, since there was scientific uncertainty about the safety of hormones, use of hormones should be forbidden either because of burden shifting or because of lowered standards of proof. The United States argued the precautionary principle was not part of customary international law. The appellate body said, "The status of the precautionary principle in international law . . . appear[ed] less than clear [and,] at least outside the field of international environmental law, still await[ed] authoritative formulation." The words "at least" indicate that even within international environmental law the appellate panel found the status of the precautionary principle as applied to risk assessment unclear, but it considered it more likely that the precautionary principle was customary international law within environmental law than elsewhere. This statement was dictum, as the panel found that regardless the precautionary principle was inapplicable because the European Union failed to present sufficient evidence of possible harm.

In 2002, the WTO expressed clearer support for the concept of precaution in international environmental law in a case brought by the United States regarding Japan's restriction on United States' apples. Japan was concerned

76. See id. at 2.

78. See id. at 33.
79. See id. at 13.
80. Id. at 13.
81. See Agne Sirinskiene, The Status of Precautionary Principle: Moving Towards a Rule of Customary Law, 118 JURISPRUDENCIJA 349, 352-53 (2009), available at http://www.mruni.eu/lt/mokslo_darbai/jurisprudencia/archyvas/dwn.php?id=226667. While the distinction between applying the precautionary principle to environmental law as opposed to other areas of law is found in other sources, see, e.g., TROUWBORST, supra note 4, at 12–17 (2006), the logic behind the distinction is not immediately clear. One possible explanation is that many critics of the precautionary principle note that it is often unclear what it means to be cautious. See e.g., Cass R. Sunstein, The Paralyzing Principle, 25 REGULATION 32, 34 (2003). For instance, in the present case, caution may suggest allowing meat grown with hormones so that less money and energy need to be spent on growing cows, or forbidding it so people do not risk diseases that are as yet unknown. By limiting the precautionary principle to environmental issues it is simpler to understand which side merits precautionary treatment. The logic behind such thinking is that environmental risks may be systematically underestimated, so the precautionary principle helps balance the scales. See HOLLY DOREMUS, ET AL., ENVIRONMENTAL POLICY LAW 18–19 (5th ed., 2008). See also Entergy Corp. v. Riverkeeper, Inc., 129 S.Ct. 1498, 1516 - 17 (2009) (Stevens, J., dissenting) ("cost-benefit analysis often, if not always, yields a result that does not maximize environmental protection.").
that the apples were infected with fire blight bacteria. The United States argued that Japan’s restrictions were too severe. After the WTO panel ruled for the United States, Japan appealed, invoking the precautionary principle to claim that the risk warranted more restrictive measures. The United States again denied the status of the precautionary principle as customary international law. The appellate body restated the result of the hormones case: “the ‘precautionary principle’ had not yet attained authoritative formulation outside the field of international environmental law.” This statement omitted the words “at least” that are found in the original quote. The WTO thereby suggested more strongly that application of the precautionary principle to risk assessment might be part of customary international environmental law.

Recognition of the principle was strongest, however, in 2003 when the United States once again sued the European Union in the WTO. The European Union had placed restrictions on the imports of plants that had been made through recombinant DNA technology, invoking the precautionary principle to defend its risk assessment. The panel again refused to decide whether the precautionary principle was part of customary international law, again disposing of the issue by finding that even if the precautionary principle was customary international law the European Union had not shown enough probability of risk. Before doing so, however, the panel noted that there were numerous conventions and declarations and domestic laws incorporating the precautionary principle. Although this would normally indicate the precautionary principle’s status as customary international law, the panel found that these “for the most part . . . [were] environmental conventions and declarations.” Even as the WTO rejected the use of the precautionary principle in this case, in dictum it almost explicitly accepted the precautionary principle as customary international environmental law.

In 2009, the United States sued the European Union for banning poultry treated with any substance other than water. The panel for this case has been established but not
III. PRECAUTIONARY PRINCIPLE IN THE INTERNATIONAL COURT OF JUSTICE

While the WTO and ITLOS have increasingly accepted the precautionary principle in matters of international environmental law, the ICJ has always been more reticent. Before Pulp Mills, the precautionary principle was exclusively mentioned in dissents and concurrences in ICJ cases but never in a majority opinion.

A. Decisions Prior to Pulp Mills

Questions of precaution might have arisen in the 1995 ICJ case Nuclear Tests (New Zealand v. France), but the principle received only a brief mention in a dissent. The conflict in this case emerged in 1973, when New Zealand asked the ICJ to ban France from testing nuclear weapons in the atmosphere. Before the ICJ could decide the case, France declared that it did not plan to test its nuclear weapons. Consequently, the ICJ dismissed the case without ruling on the merits. Oddly, the court added, "[I]f the basis of this Judgment were to be affected, the Applicant could request an examination of the situation." This provision was central to a continuation of the dispute more than twenty years later.

In 1995, France decided to conduct underground nuclear testing. By that time France had withdrawn its consent to the jurisdiction of the ICJ, so New Zealand attempted to use the ICJ's 1973 promise to reopen the case under the old jurisdiction. The majority considered New Zealand's claims to be new, because France's tests were not atmospheric tests, and therefore found that the ICJ did not have jurisdiction.

While New Zealand also invoked the precautionary principle in making its case, only a dissent issued by Judge Weeramantry responded to this aspect of composed. See European Communities—Certain Measures Affecting Poultry Meat and Poultry Meat Products from the United States, WORLD TRADE ORG., http://www.wto.org/english/tratop_e/dispu_e/cases_e/ds389_e.htm (last visited Mar. 2, 2011). It is likely that Europe will again invoke the precautionary principle, and it remains to be seen how the panel will respond.

99. See id. at 465-66.
100. See id. at 478.
106. See id. at 307.
107. See Request for an Examination of the Situation in Accordance with Paragraph 63 of the Court's Judgment of 20 December 1974 in the Nuclear Tests Case (N.Z. v. Fr.), Application Instituting
New Zealand's case. He contended not only that the ICJ had jurisdiction, but also that the precautionary principle mandated an injunction to prevent potential harm to the environment. He also argued that as France threatened serious environmental harm, it had the burden of showing the activity was safe. While many discussions of the precautionary principle understand it to include burden shifting, to Judge Weeramantry these were two distinguishable principles.

Judge Weeramantry revisited these issues the next year, when the United Nations asked the ICJ whether a state was permitted to use nuclear weapons. The ICJ ruled that while international law certainly forbade the use of nuclear weapons if there was no threat to the state’s existence, it was unclear whether use of such weapons was permitted when there was such a threat. Judge Weeramantry argued in dissent that use of nuclear weapons should always be forbidden because their use would violate the precautionary principle and, separately, “the principle that the burden of proving safety lies upon the author of the act complained of.” Again, Judge Weeramantry separated the question of burden of proof from the precautionary principle. In this opinion he did not expound explicitly on the precautionary principle, but his conclusion on the proper remedy for the principle’s violation was consistent with his previous opinion: courts should grant an injunction when there is threat of environmental harm.

Another opportunity to invoke the precautionary principle arose in the 1995 Gabčíkovo-Nagymaros case. In 1977, Czechoslovakia and Hungary agreed to build a dam on the Danube. After Czechoslovakia split into the Czech Republic and Slovakia, Slovakia insisted Hungary fulfill its

---

109. See id. at 343 (“New Zealand has placed materials before the Court to the best of its ability, but France is in possession of the actual information. The [precautionary] principle then springs into operation to give the Court the basic rationale for considering New Zealand’s request and not postponing the application of such means as are available to the Court to prevent, on a provisional basis, the threatened environmental degradation, until such time as the full scientific evidence becomes available in refutation of the New Zealand contention.”).
110. See id. at 348.
111. See Legality of the Threat or Use of Nuclear Weapons (United Nations), 1996 I.C.J. 226, 227–29 (July 8).
112. See id. at 266.
113. Nuclear Tests (N.Z. v. Fr.), 1974 I.C.J. 457, 502–03 (Dec. 20) (Weeramantry, J., dissenting). It is not entirely clear how the burden of proof can affect an advisory opinion since there is no party present that can possibly meet the burden. Judge Weeramantry probably meant that since it cannot be shown that international law allows for the use of nuclear weapons, it is therefore impossible for any state to meet the burden that would be required of it prior to launching a nuclear attack—namely the burden of proving that such an attack was legal.
obligations. Hungary was worried about the environmental effects of the project and in 1989 resolved to suspend work. It claimed the obligations of the treaty were suspended due to a "state of ecological necessity." Slovakia denied that an "ecological necessity" existed and argued that even if one did exist, the necessity would not permit Hungary to nullify the treaty. The ICJ ultimately found that while "ecological necessity" would be a sufficient reason to nullify a treaty, there was no "ecological necessity" because the harm was uncertain. The court thus seemed to implicitly reject the precautionary principle's notion that uncertain harm was sufficient to prevent an action. Additionally, the court viewed Hungary as shouldering the burden of proof, despite the fact that Slovakia was the party that would potentially damage the environment.

It is possible, however, that Gabčikovo-Nagymaros was not a repudiation of the precautionary principle. At the time that Hungary and Czechoslovakia agreed to build the dam, Hungary was already aware that there was a risk of environmental damage. Perhaps the court decided in favor of Slovakia not because it rejected the precautionary principle, but because it viewed Hungary as estopped from raising these claims. At the very least this explains why Judge Weeramantry voted with the majority despite being a proponent of the precautionary principle and burden shifting in environmental cases.

B. The Pulp Mills Case

1. History of the Case

Pulp Mills was the first time the majority opinion of the ICJ explicitly addressed the precautionary principle. Argentina had championed a broad reading of the principle in bringing its case against Uruguay. Not only did the court reject Argentina's claim, but it also undermined many previous readings of precaution, interpreting the principle far more narrowly.

In 2006, Argentina claimed Uruguay’s authorization for the construction of a pulp mill on the Uruguay River violated the 1975 Statute of the River Uruguay, a treaty between Argentina and Uruguay. The two countries had adopted the statute to create a mechanism to rationally use the River Uruguay. The statute established the Administrative Commission of the River Uruguay ("CARU") and stated that if a party planned any significant construction or modification of an existing structure, that party must notify CARU. If CARU determined there was likely to be significant damage to the environment or if CARU could not decide whether there was likely to be significant damage, the party had to notify the other party about the possible damage. If there was disagreement between the parties about the construction, either party could submit the case to the ICJ.

One important limitation was that CARU was represented equally by Argentina and Uruguay. Since CARU did not contain any provision on how to resolve deadlocks between the two countries, it could only function efficiently if both Argentina and Uruguay were already in agreement about a course of action, or at least willing to come to an agreement. Still, for the first couple of decades CARU functioned quite well. It set out rules for the use of the Uruguay River, established regulations for the Salto Grande Power Plant, and determined which parts of the Uruguay River were to be policed by which country.

In the early 2000s, however, Argentina and Uruguay’s relations became tense, eventually leading to a failure of the parties to negotiate effectively through CARU. The major source of tension was a banking crisis in Argentina, causing Argentina to close all the country’s banks. As a result, Argentines with Uruguayan bank accounts began a run on Uruguayan banks, leading to a Uruguayan economic crisis. Tensions mounted when President Batlle of Uruguay said, “All Argentines are thieves from the first to the last,” and

---

127. From the Spanish acronym for “Comisión Administradora del Río Uruguay.”
128. See id. at 341.
130. See id., Judgment, ¶ 281.
escalated further when Argentina tried to pressure Uruguay to admit to military atrocities in its past. In 2003, Uruguay declared that the construction of a pulp mill on the Uruguay River, near Fray Bentos, would not cause significant environmental harm and therefore issued a construction permit to the Empresa Nacional de Celulosa España [National Spanish Pulp Company] (ENCE). On the same day, Presidents Nestor Kirchner of Argentina and Jorge Batlle of Uruguay met. According to Argentina, the presidents agreed the project would not proceed until the environmental impacts were further studied. According to Uruguay, the parties agreed to circumvent the CARU decision-making process. Uruguay later gave Argentina ENCE’s assessment of the environmental impacts of the construction of a pulp mill. Interpretations of the assessment conflicted; Uruguay believed the assessment showed that it could continue, while Argentina thought it was too cursory. Argentina officially complained to the ICJ that Uruguay had ignored CARU. Moreover, Argentines began protesting the construction of the mill by blocking several bridges and roads connecting Argentina and Uruguay to prevent tourists from traveling into Uruguay during the holiday season. In 2006, due to the political pressure from Argentina, ENCE abandoned the project.

In 2005, Uruguay issued a permit to Botnia, another pulp producer, to construct a mill on the Uruguay River. CARU was not satisfied with Botnia’s proof that there would be no significant environmental harm and requested further documentation, but Uruguay ignored CARU’s request. Argentina then went to the ICJ, requesting that the ICJ permanently shut down the Botnia mill and declare that Uruguay violated its procedural responsibilities by ignoring

una manga de chorros, del primero al ultimo”). It seems Batlle thought his microphone was off.

139. See id. ¶ 31 (“Argentina maintains that the President of Uruguay, Jorge Battle [sic], then promised his Argentine counterpart, Néstor Kirchner, that no authorization would be issued before Argentina’s environmental concerns had been addressed.”).
140. See id.

142. See id. ¶ 22.
146. See id. ¶ 39.
147. See id. ¶ 38.
CARU the first time and by not submitting sufficient documentation the second time. In the meantime, Argentina requested a provisional closing of the mills until the ICJ decided the case. A near-unanimous court ultimately denied this request for provisional measures in 2006, on the grounds that the mills were sufficiently safe and that whatever harm Uruguay might cause was neither imminent nor irreparable. Uruguay was thus able to continue the permitting process, and the Botnia mill opened in 2007.

In 2010, the ICJ ruled that Uruguay had violated its procedural obligations to Argentina. First, while Uruguay had notified CARU of its plan, it had not responded to CARU’s requests for further documentation to show that there would be no significant environmental harms. Second, Uruguay had violated its obligation to notify Argentina in a timely manner of its plans to grant the pulp mills a permit. Third, the ICJ questioned whether Batlle and Kirchner had ever come to a personal agreement, and ruled that even if they had, Uruguay had not followed through with the terms of the supposed agreement. Finally, the ICJ held that the supposed agreement never included the Botnia Mill.

Despite these procedural violations, the ICJ ruled that Uruguay had not violated its substantive obligations and could therefore continue running the mill. Argentina had claimed that Uruguay should bear the burden of proof that the mills did not cause environmental harm because of the precautionary principle. The ICJ rejected this claim, concluding, “[W]hile a precautionary approach may be relevant in the interpretation and application of the provisions of the Statute, it does not follow that it operates as a reversal of the burden of proof.”

---

148. See id. ¶ 268.
150. See id. at 134–35. The only dissenting judge was Judge ad hoc Vinuesa, see id. at 135, who was nominated by Argentina. See id. at 119.

157. See id. ¶ 282.
The ICJ then found that Argentina had failed to meet its burden of proof for all the environmental harms it claimed were likely to result. The ICJ thus ruled that while Uruguay had violated its procedural obligations, the permit for the pulp mill did not violate any substantive obligations.

2. The New Precautionary Principle

Pulp Mills has important implications for the precautionary principle. First, the decision explicitly ruled that precaution did not reverse the burden of proof. In addition, the court offered many more subtle statements on how precaution should be used. When discussing the standard of proof, for example, the ICJ never mentioned the precautionary principle at all, and held Argentina to the standard of “convincing,” “clear,” and “conclusive” evidence.

In particular, the ICJ demanded a high level of proof when it came to Argentina’s claim that the mills were discharging an unacceptable amount of chlorinated organic material. Under the Statute of the River Uruguay, the maximum allowable effluent was a yearly average of 6 milligrams per liter of adsorbable organic halogens, but at one point concentrations reached 13 milligrams per liter. While Uruguay found this high concentration in only one measurement, Argentina questioned Uruguay’s monitoring of the halogens generally and found this incident indicative of a broader chlorine pollution problem. The ICJ ruled for Uruguay because “in the absence of convincing evidence that this is not an isolated episode but rather a more enduring problem, the Court is not in a position to conclude that Uruguay has breached

(separate opinion of Judge Yusuf) (voting with the majority, but agreeing that the issues were sufficiently complicated that the court should have appointed scientific experts).
168. See id., Judgment, ¶ 228.
169. See id.
the provisions of the 1975 Statute.\textsuperscript{171} The ICJ thus held that Argentina needed to show "convincing evidence" that Uruguay was regularly violating the statute; simply showing there was reason for concern about Uruguay's actions was insufficient.

Argentina also claimed the pulp mill emitted nonylphenols, endangering the river environment.\textsuperscript{172} The level of nonylphenols in the Uruguay River near the mills had gone up since the mill opened, harming local wildlife.\textsuperscript{173} Since other parts of the river had lower levels of nonylphenols, and nonylphenols are commonly used in pulp mills, Argentina argued that the source must have been the mills.\textsuperscript{174} Uruguay argued the mill did not use any nonylphenol precursors and could therefore not be the source of the nonylphenol.\textsuperscript{175} The ICJ again ruled in favor of Uruguay because Argentina had not "adduced clear evidence which establishes a link between the nonylphenols found in the waters of the river and the Orion (Botnia) mill."\textsuperscript{176} Again, the risk of environmental harm did not lower the standard of proof; Argentina had to show "clear evidence" in order to prevail.

In these questions of standard of proof and burden shifting, the ICJ seemed to reject conclusively the interpretation of the precautionary principle accepted by ITLOS and the WTO. However, it did not ignore precaution entirely, noting, "[A] precautionary approach may be relevant in the interpretation and application of the provisions of the Statute."\textsuperscript{177} Indeed, in a post-\textit{Pulp Mills} decision, ITLOS saw this acknowledgment as an affirmation of the precautionary principle.\textsuperscript{178} While the court did not find precaution necessary in this case, perhaps its understanding of precaution more broadly was similar to Judge Weeramantry's \textit{Nuclear Tests (New Zealand v. France)} dissent,\textsuperscript{179} which read precaution to mean that the court can issue injunctions in cases where a threshold of harm is met. Given the paucity of the ICJ's discussion of the precautionary principle, it is difficult to be sure.

\end{footnotesize}
3. Environmental Impact Assessments versus the Precautionary Principle

While the court understood the precautionary principle narrowly, it did mandate the use of environmental impact assessments, "a national procedure for evaluating the likely impact of a proposed activity on the environment." As ITLOS has since noted, Pulp Mills mandated environmental impact assessments as an obligation of general international law.

Scholars and judges have noted that environmental impact assessments are clearly precautionary in nature, in that states consider likely impacts before commencing a potentially harmful activity. It thus seems paradoxical that the same decision that rejected burden shifting and lowered standards of proof in international litigation also mandated that individual countries take a precautionary approach via environmental impact assessments when there is a serious environmental risk.

The ICJ's institutional interests as well as practical considerations explain this discrepancy. One institutional concern in applying the precautionary principle to lower the standard or shift the burden of proof is that it would force courts to take a more active role in international disputes by making it easier to bring cases against states acting in a way that might harm the environment.

182. See Pulp Mills on the River Uruguay (Arg. v. Uru.), Judgment, ¶ 204 ("It may now be considered a requirement under general international law to undertake an environmental impact assessment where there is a risk that the proposed industrial activity may have a significant adverse impact in a transboundary context, in particular, on a shared resource."). In its recent opinion, ITLOS too acknowledged that environmental impact assessments are part of customary international law. Responsibilities and Obligations of States Sponsoring Persons and Entities with Respect to Activities in the Area: Advisory Opinion, ¶ 150, INT'L TRIB. L. OF THE SEA, http://www.itlos.org (last visited Mar. 9, 2011) (follow “Proceedings & Cases” hyperlink, then follow “list of cases” hyperlink, then “Case No. 17” hyperlink) (Advisory Opinion of 1 February 2011).

184. See supra Part III.b.ii.
However, given that the ICJ cannot enforce its own judgments and enforcement is at the discretion of the United Nations,\footnote{See U.N. Charter art. 94, para. 2. In fact, it seems the United Nations has never enforced an ICJ decision. See Adele Ramos, \textit{ICJ STATS—Enforcement of ICJ Rulings}, \textit{Amandala} (Jan. 30, 2009), http://www.amandala.com.br/index.php?id=8092). This is in contrast to the ICJ’s predecessor, the Permanent Court of International Justice, whose decisions were enforced by the United Nations’ predecessor, the League of Nations. \textit{See Covenant of the League of Nations} art. 13.} the ICJ could find itself weakened if its decisions are too aggressive to be enforced.\footnote{See, e.g., Armed Activities on the Territory of the Congo (Congo v. Uganda), Provisional Measures, 2000 I.C.J. 131, 132 (July 1) (declaration of Judge Oda) (“[T]he repeated disregard of the judgments or orders of the Court by the parties will inevitably impair the dignity of the Court and raise doubt as to the judicial role to be played by the Court in the international community.”). \textit{Accord Giles v. Harris}, 189 U.S. 475, 488 (1903) (opinion for the court by Holmes, J.) (deciding that the Supreme Court of the United States will not find the Alabama voting system unconstitutional for several reasons, including that the Court does not have the practical capabilities to enforce such a decision).} In most cases, parties voluntarily opt in to the ICJ’s jurisdiction.\footnote{See Shigeru Oda, \textit{The Compulsory Jurisdiction of the ICJ: A Myth?}, 49 \textit{Int’l & Comp. L.Q.} 251, 263–64 (2000) (an article by a justice of the ICJ showing that when the ICJ finds jurisdiction when the losing party does not think the ICJ should, the losing party often does not comply with the court’s order and subsequently the losing party sometimes withdraws its grant of jurisdiction to the ICJ).} If the ICJ does not act with restraint, it would discourage countries from submitting to its jurisdiction, making the ICJ irrelevant.\footnote{\textit{See Tom Ginsburg, \textit{International Judicial Lawmaking}, in \textit{International Conflict Resolution} 155, 176–79 (Stefan Voight, Max Albert & Dieter Schmidtchen eds., 2006).} \textit{See Pulp Mills on the River Uruguay} (Arg. v. Uru.), Judgment, ¶ 221 (Apr. 20, 2010), available at http://www.icj-cij.org/docket/files/135/15877.pdf.} Some have even suggested that unpopular ICJ decisions are the reason the United Nations has reduced the ICJ budget.\footnote{\textit{See id.} ¶ 222.}

Additionally, it is not always clear what erring on the side of the environment means. For instance, Argentina wanted Uruguay to decrease pollution by installing another round of treatment to the effluent.\footnote{\textit{See Cass R. Sunstein, \textit{The Paralyzing Principle}, 25 \textit{Regulation} 32, 34 (2003).}} Uruguay argued that the energy consumption and carbon emissions required to run such a treatment would outweigh the benefits.\footnote{\textit{See id.} ¶ 222.} Even if the ICJ only wanted the best possible outcome for the environment, it is not clear what it should dictate when both the problem and solution have negative environmental consequences.\footnote{\textit{See id.} ¶ 222.}

Finally, the ICJ was hesitant to invoke the precautionary principle because uniformly erring on the side of the environment when the science was uncertain would be bad policy. In \textit{Pulp Mills}, for example, the mills represented 2 percent
of Uruguay’s gross domestic product. In cases where such significant economic benefit is at stake, the ICJ would not want to be compelled to err on the side of the environment when harms were so uncertain. Favoring environmental impact assessments, meanwhile, would not bind the ICJ, and by extension the states, in any way, but would likely diminish environmental harm when harm was more certain. The ICJ, however, will not overrule a state’s impact assessment unless another party proves that assessment “clearly,” “convincingly,” or “conclusively” wrong.

In 2008, President Wolfrum of ITLOS highlighted these differences between his tribunal and the ICJ: “The jurisprudence of the [ICJ] has hitherto not accepted the precautionary approach as a binding principle of international law. [ITLOS], when asked to prescribe provisional measures for the protection and conservation of southern bluefin tuna fish stocks, nevertheless relied upon such principle.” While Pulp Mills may indicate that the ICJ sees some vaguely defined role for the precautionary principle, the two tribunals certainly applied the precautionary principle in vastly different manners. ITLOS, and the WTO in dicta, interpreted the precautionary principle as granting definite legal rights: it either lowered the standard of proof or reversed the burden of proof, making it simpler to obtain an injunction. The ICJ, meanwhile, understands the precautionary principle as granting fewer (or no) substantive rights. Rather, it favors the use of environmental impact assessments, leaving the ICJ more options in ruling on environmental cases.

The question then arises why ITLOS, which is even less capable of enforcing its own decisions than the ICJ, took a far more progressive approach to the precautionary principle. One possibility is that the five countries with permanent members on the Security Council have always had a judge on the ICJ. Of these countries, China, Russia, the United States and the

---

United Kingdom have been ambivalent towards the precautionary principle.\textsuperscript{199} Thus, the bias that international judges tend to show towards their own countries\textsuperscript{200} would make the ICJ limit applications of the precautionary principle. On ITLOS, meanwhile, no countries have permanent representatives,\textsuperscript{201} so the weight of judges from those powerful countries is less likely to be determinant.

CONCLUSION

In a broad sense, the cards were stacked against Argentina in \textit{Pulp Mills}. It is highly unlikely the ICJ would obligate Uruguay to shut down mills that represented 2 percent of its gross domestic product,\textsuperscript{202} or even to significantly modify the way Uruguay operated the mills.\textsuperscript{203} As discussed above, the ICJ must be careful not to issue remedies that a party ignores.\textsuperscript{204} In fact, Argentina's satisfaction with the final decision—focusing on the ICJ's finding that Uruguay had violated its procedural obligations\textsuperscript{205}—may reflect recognition that winning the substantive issues was never a possibility.

However, even if it was a foregone conclusion that Uruguay would win, the ICJ's narrowing of the precautionary principle in reaching this conclusion is important. This is especially true given that a broader reading of the precautionary principle was not necessarily in conflict with Uruguay's position. For example, Judge Trindade vigorously protested the short shrift given to the

\textsuperscript{201} Indeed, there have been no judges from the United States in ITLOS. \textit{See General Information—Judges}, ITLOS, http://www.itlos.org (last visited Mar. 9, 2011) (follow "General Information" hyperlink, then follow "Judges" hyperlink, then "Judges" hyperlink). Additionally, the fact that a country will not always be represented may mean that even the countries that are represented are less able to enforce their jurisprudence on the tribunal.

\textsuperscript{204} See supra Part III.b.iii.

\textsuperscript{205} \textit{See Uruguay's and Argentina Celebrate Court's Ruling on Pulp Mill Dispute}, MERCOPRESS (Apr. 20, 2010), http://en.mercopress.com/2010/04/20/uruguay-s-and-argentina-celebrate-court-s-ruling-on-pulp-mill-dispute. Of course it is possible that Argentina was just saving face.
precautionary principle in the majority's opinion in *Pulp Mills*, yet still voted with the majority. Additionally, Uruguayan law explicitly recognizes the precautionary principle, and yet Uruguay permitted the pulp mills. The precautionary principle was thus not necessarily fatal to Uruguay's case, and did not require the narrow reading the ICJ ultimately gave it in *Pulp Mills*.

There are several ways the ICJ could have offered a broader reading of the precautionary principle and still sided with Uruguay. For example, it could have found that Argentina had not shown enough likelihood of harm or that the threatened harm it did show was not severe enough. Alternatively, the court could have ruled that the precautionary principle does not apply to situations in which the economic benefit clearly outweighs the potential environmental harm. While most formulations of the precautionary principle omit such a limitation, the Rio Declaration included a provision that called for "cost-effective measures" in applying the precautionary principle, thus suggesting that the benefits of precaution must be weighed against its economic costs. Nonetheless, the court did not go this route and instead, by requiring certainty of harm, rejected most common understandings of precaution. Ultimately, the ICJ's decision in *Pulp Mills* left only a vaguely defined and weak precautionary principle. On the other hand, ITLOS still stands by its decision in the *Bluefin*.
